Wholesale China Anterior Bite Plane, Dental, Custom orders are acceptable with different quality grade and customer's especial design. We are looking forward to establish the good and successful cooperation in business with long terms from the customers of all over the world.

An anterior bite plane is an appliance that has no posterior occlusion. The concept of this appliance is to separate the posterior teeth to help decrease muscle activity during clenching and grinding. Since there is no posterior occlusion, the lateral pterygoid is able to release and allows the condyle to seat.

Although there are different kinds of anterior bite planes, all the appliances are conceptually the same relative to the lack of posterior occlusion.
